About the National Inpatient Experience Survey 2019

The National Inpatient Experience Survey¹ is a nationwide survey that offers patients the opportunity to describe their experiences of public acute healthcare in Ireland. The survey is a partnership between the Health Information and Quality Authority (HIQA), the Health Service Executive (HSE) and the Department of Health. It was conducted for the first time in 2017 and repeated in 2018 and 2019.

Nationally, 26,897 people were invited to participate in the third National Inpatient Experience Survey. In total, 12,343 people responded, resulting in a response rate of 46%. 296 patients from Naas General Hospital took part.

The aim of the survey is to find out about patients' experiences in public acute hospitals and to use their feedback to identify areas of good experience, and areas needing improvement. The HSE responded to the 2017 and 2018 survey results by producing detailed quality improvement plans at national, hospital group and hospital levels. The implementation of these plans is coordinated by an oversight group, and a wide range of initiatives have already been introduced across Ireland's public acute hospitals. Some examples of these initiatives can be seen at https://yourexperience.ie/inpatient/hospital-initiatives/.

What were the main findings for Naas General Hospital?

The majority of participants from Naas General Hospital reported positive experiences in hospital. 80% of participants said they had 'good' or 'very good' overall experiences, compared with 84% nationally. The hospital scored about the same as the national average for 'care on the ward', and scored below the national average for the other stages of care and for overall experience.

Two areas of good experience were identified. These were areas where participants gave significantly above-average ratings. For example, many patients gave a positive rating of the hospital food, and said that they were always offered a choice of food.

There were also three areas needing improvement. While the majority of patients felt that they were treated with respect and dignity in the emergency department and the wider hospital, the hospital scored below the national average for the two

¹ The survey was previously entitled the 'National Patient Experience Survey'. The name was updated in 2019 to more accurately reflect the target population.

questions covering this area. Some patients also said that while they were in the emergency department, they were not always given clear answers to their questions.

Patient ratings of 'admissions', 'care on the ward' and 'examinations, diagnosis and treatment' were significantly lower than in the 2018 survey, while ratings of 'discharge or transfer' and overall experience were about the same.

The findings of the 2019 survey will help Naas General Hospital to improve patients' experiences of care in hospital.

Hospital and participant profile

Naas General Hospital is located in Co. Kildare. There were 189 inpatient beds available in the hospital during the survey period of May 2019.

626 people discharged from Naas General Hospital during the month of May 2019 were invited to participate in the survey. 296 people completed the survey, achieving a response rate of 48%. 48.3% of participants were male and 51.7% were female. 280 respondents (94.6%) said that their stay in hospital was due to an emergency. Figure 1 below provides information on the respondents who took part in the survey from Naas General Hospital.

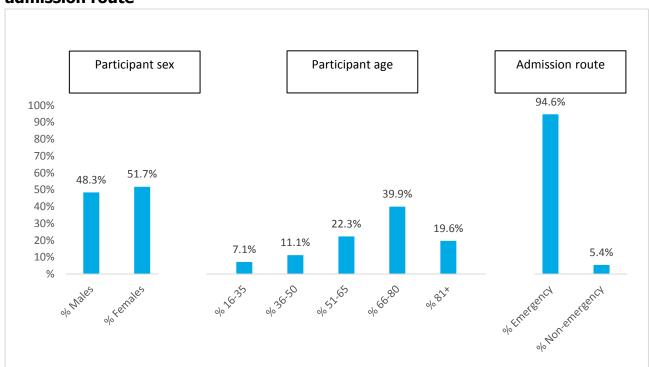

Figure 1 Participants from Naas General Hospital by sex, age group and admission route

Areas of good experience and areas needing improvement

This section lists the areas where most patients had positive experiences, and those areas where there is the most room for improvement. The list includes the relevant stage of care and question number for each area. Appendix 1 explains how these areas were identified.

The areas of good experience in Naas General Hospital are:

Care on the ward Food rating | Q15

Of the 263 people who answered this question, 226 (86%) said that the hospital food was 'good' or 'very good'.

Care on the ward

Choice of food | Q16

Of the 260 people who answered this question, 214 (82%) said that were always offered a choice of food.

The areas needing improvement in Naas General **Hospital are:**

Admissions

Clear answers from a doctor in the emergency department | Q3

Of the 237 people who said they had guestions to ask in the emergency department, 144 (61%) said that they always got answers they could understand. The hospital scored below the national average on this question.

Admissions

Respect and dignity in the emergency department | Q6

Of the 273 people who answered this question, 201 (74%) said that they were always treated with respect and dignity in the emergency department. This was below the national average.

Page 6 of 26

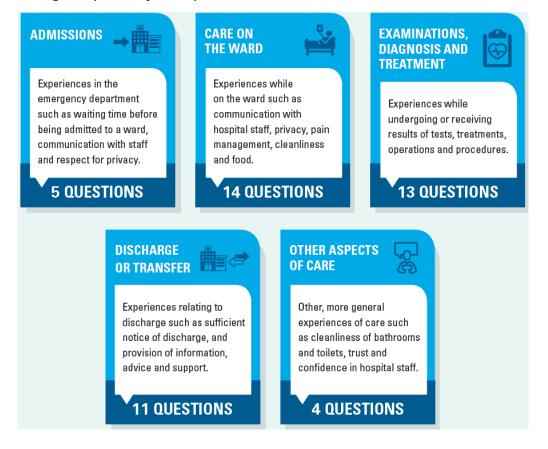

Other aspects of care

Respect and dignity | Q51

207 people (76%) said that they were always treated with respect and dignity. The hospital scored below the national average on this question.

Survey results for the stages of care along the patient journey

The National Inpatient Experience Survey 2019 follows the patient journey through hospital from admission to discharge. The 2019 questionnaire is available to download from <u>www.yourexperience.ie</u>. The survey questions were grouped into five stages along the patient journey:

Interpreting the results for the stages of care

Scores out of 10 are given for each question belonging to a stage of care or to a stage as a whole. A score of 0 indicates a very negative experience and a score of 10 indicates a very positive experience. Sometimes questions are described as high-or low-ranking questions. These are questions with the highest or lowest score when compared to a set of questions.

Statistical tests were carried out to examine if there were significant differences in patient experience between 2018 and 2019, as well as between a hospital and the national average. Throughout this report, when the hospital scored significantly above the national average, this is described as 'higher'. When a hospital scored significantly below the national average, it is described as 'lower'. When there is no statistically significant difference between the hospital's score and the national average, it is described as 'about the same'. For further information on the analyses please consult Appendix 3 of the 2019 national report, available from www.yourexperience.

Changes in patient experience over time

Patient ratings of 'admissions', 'care on the ward' and 'examinations, diagnosis and treatment' were significantly lower than in the 2018 survey. There was no significant change in ratings of 'discharge or transfer' and overall experience. Figure 2 shows a comparison of scores for individual stages of care. It is important that these changes are interpreted with caution as scores will naturally vary from year to year for a variety of reasons. Several rounds of survey data will be required before meaningful trends and changes in patient experience can be accurately identified.

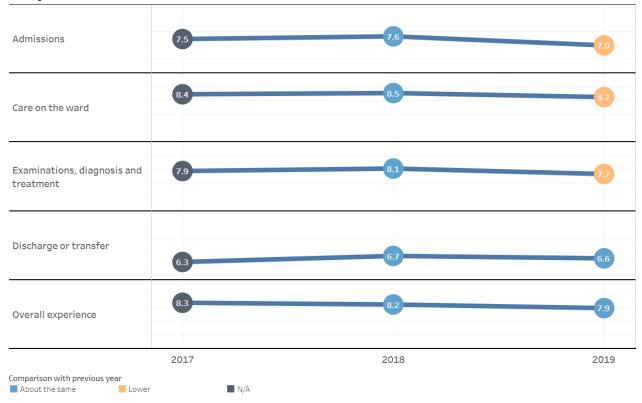

Figure 2 Annual comparison of stage of care scores² for Naas General Hospital

² Scores for the stages of care were constructed by calculating the average scores for all the questions belonging to that stage.

Page 8 of 26

We're committed to excellence in healthcare

ADMISSIONS

Experiences in the emergency department such as waiting time before being admitted to a ward, communication with staff and respect for privacy.

5 QUESTIONS

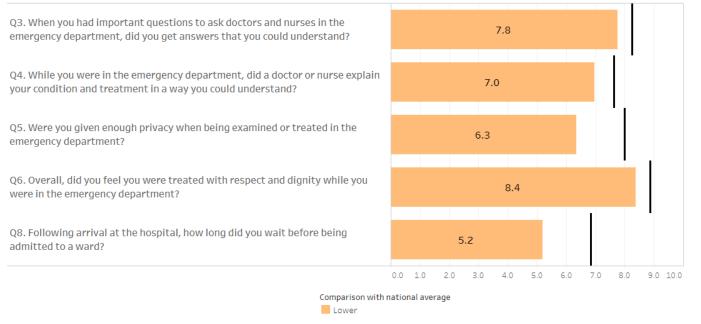

Admissions

Figure 3 compares the hospital's overall score for 'admissions' with the national average. Figure 4 shows the hospital's scores for questions on this stage of care.

Figure 3 Comparison of Naas General Hospital with the national average score for 'admissions' (out of a maximum of 10).

An Roinn Sláinte Department of Health

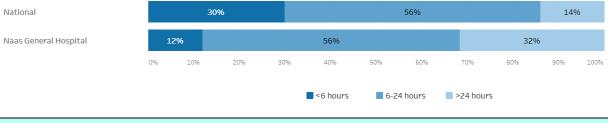

Emergency department waiting times³

The HSE sets targets for the performance of acute hospitals, including targets on waiting times in emergency departments, such as:

- 75% of people attending the emergency department are discharged or admitted to a ward within six hours of registration and none should wait for longer than nine hours.
- 95% of people attending the emergency department aged 75 years or older are discharged or admitted to a ward within six hours of registration and none should wait for longer than nine hours.

In Naas General Hospital, 29 respondents (12%) said they were admitted to a ward within six hours of arriving at the emergency department, while 137 respondents (56%) reported waiting between six and 24 hours. 77 respondents (32%) said that they waited 24 hours or more before being admitted to a ward in Naas General Hospital, with 28 of these saying they waited more than 48 hours. As outlined in Appendix 1, the relationship between waiting times and overall experience was relatively weak. This means that patients who had long waiting times did not always say they had a negative overall experience. Figure 5 outlines the emergency department waiting times, as reported by patients in Naas General Hospital, compared with the national average.

Figure 5 Emergency department waiting times, as reported by patients for Naas General Hospital and nationally

Admissions: what do these results mean?

Patient ratings of admission to Naas General Hospital were lower than the national average, and the hospital's 2018 score. Most patients said they were treated with respect and dignity in the emergency department but the hospital scored below the national average for this question. The lowest scoring question for this stage related to waiting times for admission to a ward.

³ The HSE measures emergency department waiting times differently to the survey, namely from the time a patient registers at the emergency department until they leave it. It is likely that there are some differences between survey findings and the official HSE figures. The HSE 2019 targets can be viewed at: <u>https://www.hse.ie/eng/services/publications/kpis/acute-hospitals-metadata-2019.pdf</u>

CARE ON THE WARD

Experiences while on the ward such as communication with hospital staff, privacy, pain management, cleanliness and food.

14 QUESTIONS

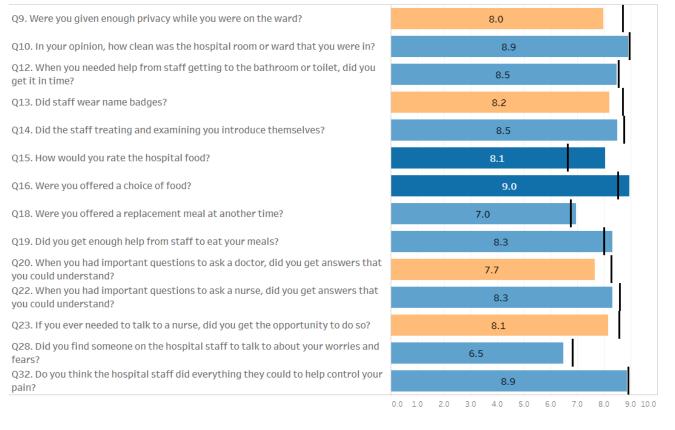

Care on the ward

Figure 6 compares the hospital's overall score for 'care on the ward' with the national average. Figure 7 shows the hospital's scores for questions on this stage of care.

Lower

Care on the ward: what do these results mean?

Naas General Hospital received patient ratings of 'care on the ward' that were below the national average, and below last year's survey. Most patients said that they were always offered a choice of food. The lowest scoring question for this stage related to whether patients could find someone to talk to about their worries and fears.

EXAMINATIONS, DIAGNOSIS AND TREATMENT

Experiences while undergoing or receiving results of tests, treatments, operations and procedures.

13 QUESTIONS

Examinations, diagnosis and treatment

Figure 8 compares the hospital's overall score for 'examinations, diagnosis and treatment' with the national average. Figure 9 shows the hospital's scores for questions on this stage of care.

Examinations, diagnosis and treatment: what do these results mean?

Ratings of 'examination, diagnosis and treatment' were below the national average and last year's survey. Most patients said that staff explained the risks and benefits of procedures in a way that they could understand. The lowest scoring question for this stage related to the time patients had to discuss their care and treatment with a doctor.

Page 14 of 26

DISCHARGE OR TRANSFER

Experiences relating to discharge such as sufficient notice of discharge, and provision of information, advice and support.

11 QUESTIONS

Discharge or transfer

Figure 10 compares the hospital's overall score for 'discharge or transfer' with the national average. Figure 11 shows the hospital's scores for questions on this stage of care.

Q40. Did you feel you were involved in decisions about your discharge from hospital? Q41. Were you or someone close to you given enough notice about your discharge? Q42. Before you left hospital, did the healthcare staff spend enough time explaining about your health and care after you arrive home? Q43. Before you left hospital, were you given any written or printed information about what you should or should not do after leaving hospital? Q44. Did a member of staff explain the purpose of the medicines you were to take at home in a way you could understand? Q45. Did a member of staff tell you about medication side effects to watch for when you went home? Q46. Did a member of staff tell you about any danger signals you should watch for after you went home? Q47. Did hospital staff take your family or home situation into account when planning your discharge? Q48. Did the doctors or nurses give your family or someone close to you all the information they needed to help care for you? Q49. Did hospital staff tell you who to contact if you were worried about your condition or treatment after you left hospital? Q50. Do you feel that you received enough information from the hospital on how

*The black line represents the national average

to manage your condition after your discharge?

We're committed to excellence in healthcare

An Roinn Sláinte Department of Health

Discharge or transfer: what do these results mean?

Participant ratings for this stage of care were below the national average and similar to last year's survey. Most patients said that staff explained the purpose of medications they were to take at home. The lowest scoring question for this stage related to whether the potential side effects of medication were explained to patients.

OTHER ASPECTS

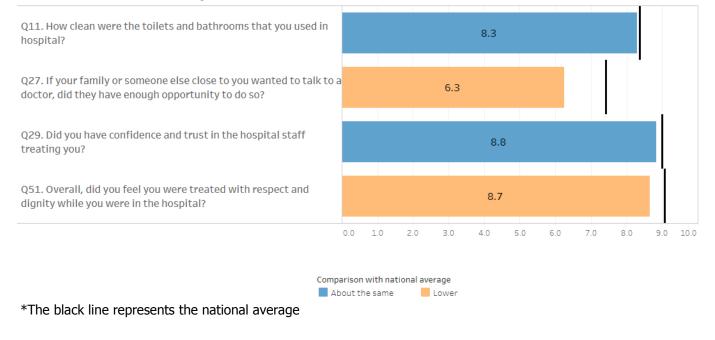

Other, more general experiences of care such as cleanliness of bathrooms and toilets, trust and confidence in hospital staff.

4 QUESTIONS

Other aspects of care

Figure 12 shows the hospital's scores for questions on this stage of care.

Figure 12 Naas General Hospital scores for `other aspects of care'*

Other aspects of care: what do these results mean?

Most participants said they always had confidence and trust in the staff that treated them. On the other hand, a number of patients said that there were insufficient opportunities for their families to talk to a doctor.

An Roinn Sláinte Department of Health

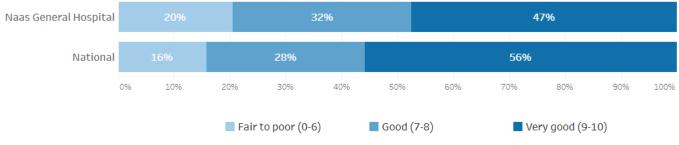

Overall experience

Respondents were asked to rate their overall hospital experience on a scale from 0 to 10, with 10 being the most positive experience, and 0 the most negative experience. 47% of participants from Naas General Hospital rated their care as very good, below the national figure of 56%.

Figure 13 compares the average overall rating of hospital experience for Naas General Hospital with the national average.

Figure 13 Overall rating of hospital experience for Naas General Hospital and nationally

In their own words: analysis of patients' comments

The last three questions (questions 59-61) of the survey asked patients to provide additional information, in their own words, on their experiences in hospital. These free-text questions allowed people to give a more in-depth description of specific aspects of their care. It also allowed them to talk about various things (good or bad) that could not be captured by the structured questions. In total, 442 comments were received from patients of Naas General Hospital in response to the free-text questions in the 2019 survey.

Figure 14 shows the breakdown of comments by theme for each of the three openended questions. Q59 asked participants what was particularly good about their hospital care, Q60 asked participants what could be improved, and Q61 asked participants for any other comments or suggestions.

In relation to good aspects of care, most of the comments related to the 'hospital staff', 'general and other comments' and 'food and drink' themes. Most patient suggestions for improvement related to the 'physical environment'; 'hospital staff', and 'ED environment or waiting times' themes. Responses to Q61 covered various themes. A selection of relevant comments from these themes is provided in Figure 15.

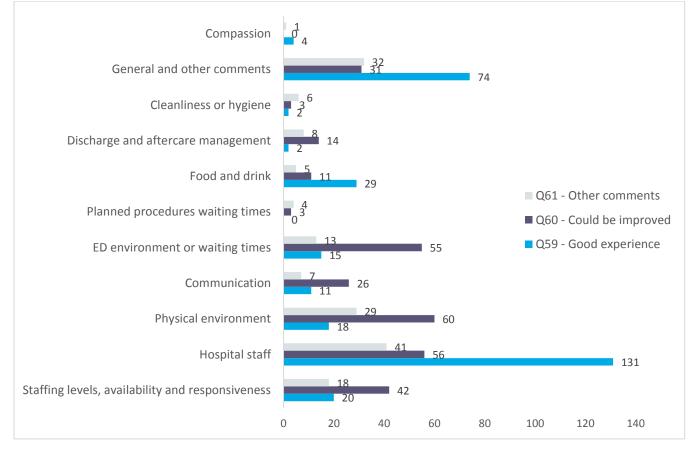

Figure 14 Participant comments by theme

Page **19** of **26**

We're committed to excellence in healthcare

An Roinn Sláinte Department of Her

Hormation and Quality Activity Activity

Figure 15 Example comments

Positive comments

"I found staff were very good and very attentive to my requests from when I arrived to when I was discharged, it was an enjoyable experience."	"I received very good care during my stay in hospital. The nurses were very caring."
"My overall experience in the hospital was good. All the nurses and doctors were very helpful and showed a duty of care to us patients."	"I had exceptional care from all members of staff. The food was very good."
"Food was nicely made & was very hot & tastefully presented. Catering & caring staff tried to obtain what the patient liked, especially when he might not have felt too well."	"The food in the hospital is very good; the menu has a good variety of food."

Suggestions for improvement

"The blinds are not working on some of the windows; this is awful as daylight comes in first thing in the morning and people are awake from 4, also some blinds are missing."

"Possible communication around delays. Even the smallest gesture, i.e. checking how the patient is doing. If any delays let people know rather than leave them not knowing. A general announcement would do."

"I would like to have had more connection with a doctor to talk me through my illness and treatment for same."

Conclusion

What were patients' experiences of hospital care in Naas General Hospital in May 2019?

The majority of patients said that they had positive overall experiences in Naas General Hospital. 80% of patients said they had a 'good' or 'very good' experience, compared with 84% nationally.

Naas General Hospital scored about the same as the national average for 'care on the ward' and below the national average for the other stages of care and overall experience. Participant ratings of 'admissions', 'care on the ward' and 'examinations, diagnosis and treatment' were lower than in the 2018 survey, while ratings of 'discharge or transfer' and 'overall experience' were about the same.

Two areas of good experience were identified. These were areas where participants gave significantly above-average ratings. For example, many patients gave a positive rating of the hospital food, and said that they were always offered a choice of food.

There were also three areas needing improvement. While the majority of patients felt that they were treated with respect and dignity in the emergency department and the wider hospital, the hospital scored below the national average for the two questions covering this area. Some patients also said that they while they were in the emergency department they were not always given clear answers to their questions.

The findings of the 2019 survey will be used to help Naas General Hospital improve the experiences of patients in hospital.

Page 21 of 26

Appendix 1: Areas of good experience and areas needing improvement

Improvement map

It is important for hospitals to know if they scored above or below the national average for each question, and this is shown in the improvement map in Figure 16. The improvement map also shows which questions are related to patients' overall experience in hospital. Some questions had a stronger relationship with overall experience than others.

For example, Question 51 which asked patients if they were treated with respect and dignity had a strong relationship with overall experience. This means that patients who said they were treated with respect and dignity were very likely to give a positive rating of their overall experience. Patients who felt they were not treated with respect and dignity tended to give more negative ratings of their overall experience.

Other questions had a weaker relationship with overall experience – this means that patients' experiences in these areas had little bearing on how they rated their overall experience. An example is Question 16 which asked patients if they were offered a choice of food. The relationship between being offered a choice of food and patients' ratings of their overall experience was weak. This means that even if they were always offered a choice of food, patients may have given negative ratings of their overall experience, or if they were never offered a choice, patients may still have given positive ratings of their overall experience.

It is useful for hospitals to know which questions strongly relate to their patients' overall experience as these are the areas on which they should focus their improvement efforts.

In Figure 16, each dot shows a specific survey question for Naas General Hospital. Questions at the top of the graph are strongly related to overall experience, while those at the bottom have a weaker relationship. Questions to the right of the graph scored below the national average, while those on the left scored above it.

Questions that scored significantly above average and had a stronger relationship with overall experience are areas of good experience. Questions that scored significantly below average and had a stronger relationship with overall experience are areas needing improvement.

The improvement map for each hospital is unique and gives specific information on where a hospital is doing well, and areas where improvements are needed. More information on the science behind the improvement map is available below. An interactive version of the improvement map is also available at http://www.yourexperience.ie/ along with instructions on how to interpret it.

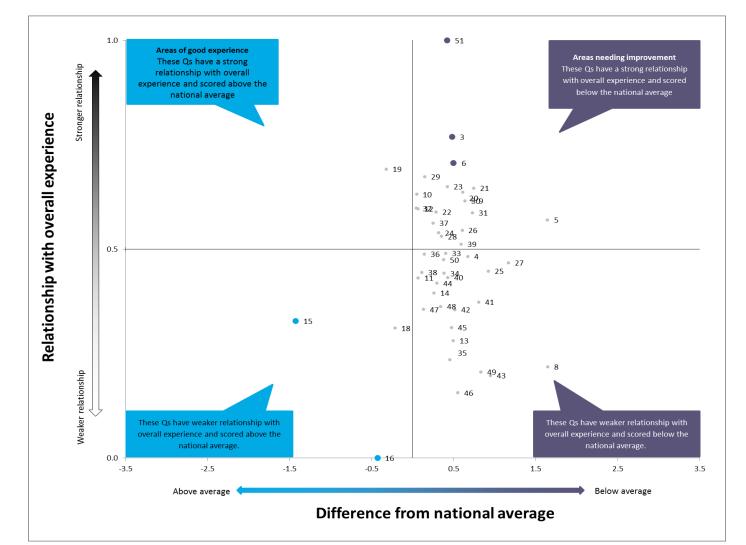

Figure 16 Improvement Map for Naas General Hospital

We're committed to excellence in healthcare

How the improvement map is constructed

The improvement map is constructed by charting the normalised correlation between each question and overall experience on the vertical axis, against the difference between the hospital average and national average for each question on the horizontal axis.

What is correlation?

Correlation is a measure of the relationship between two variables. For example, in general there is a strong correlation between patients saying they were treated with respect and dignity, and patients giving a positive rating of their overall experience in hospital. It can thus be said that there is a strong correlation between respect and dignity, and overall experience. A 'correlation coefficient' is a number between 0 and 1 that represents the strength of a relationship, with 1 being the strongest possible relationship and 0 indicating that there is no relationship. Correlation does not tell us if a change in one variable is caused by a change in the other.

How do we calculate the correlation coefficient?

The first step in calculating the correlation coefficient between two variables is to calculate their 'covariance'. Covariance is a simple measure of the relationship between two variables and is calculated using the formula below:

$$\operatorname{cov}_{xy} = \frac{\sum (x_i - \overline{x})(y_i - \overline{y})}{n - 1}$$

While covariance does measure the relationship between variables, it does so in an unstandardised way, depending on the scale of measurement used. This makes comparing covariances measured on different scales problematic. In order to get around this issue, 'standardisation' must be carried out. In order to do this, the covariance for both variables must be divided by the product of the standard deviations for each variable. The formula below shows how standardisation is carried out, resulting in *r*, known as the 'Pearson correlation coefficient'.

$$r = \frac{\operatorname{cov}_{xy}}{s_x s_y} = \frac{\sum (x_i - \overline{x})(y_i - \overline{y})}{(N - 1)s_x s_y}$$

The final step in the analysis is to normalise the correlation coefficients between 0 and 1 using the below formula:

$$r = \frac{r - r_{\min}}{r_{\max} - r_{\min}}$$

In Figure 16, we plot the correlation coefficients between each question and overall experience on the vertical axis. Each question's difference from the national average is plotted on the horizontal axis.

How do we calculate difference from the national average?

Statistical tests were carried out to examine if there were significant differences between a hospital's score for each question and the national average for that question. A z-test was used to compare question scores at the 99% confidence level. A z-test is a statistical test used to examine whether two population mean scores are different. A statistically significant difference means it is very unlikely that results were obtained by chance alone if there was no real difference. Therefore, when a score is significantly 'higher than' or 'lower than' the national average, this is highly unlikely to have occurred by chance.
