Stages of care

Admission to hospital

8.3

out of 10

Patient ratings of admission to the hospital were higher than the national average and the hospital's 2018 score.

Care on the ward

8.3

out of 10

Patient ratings of 'care on the ward' in the hospital were similar to the national average, and to last year's survey.

Examination, diagnosis and treatment

8.2

out of 10

Ratings of 'examination, diagnosis and treatment' were similar to the national average and to last year's survey.

Discharge or transfer

7

out of 10

Participant ratings of 'discharge or transfer' were similar to the national average and to last year's survey.

About the National Inpatient Experience Survey 2019

The National Inpatient Experience Survey¹ is a nationwide survey that offers patients the opportunity to describe their experiences of public acute healthcare in Ireland. The survey is a partnership between the Health Information and Quality Authority (HIQA), the Health Service Executive (HSE) and the Department of Health. It was conducted for the first time in 2017 and repeated in 2018 and 2019.

Nationally, 26,897 people were invited to participate in the third National Inpatient Experience Survey. In total, 12,343 people responded, resulting in a response rate of 46%. 479 patients from Our Lady of Lourdes Hospital took part.

The aim of the survey is to find out about patients' experiences in public acute hospitals and to use their feedback to identify areas of good experience, and areas needing improvement. The HSE responded to the 2017 and 2018 survey results by producing detailed quality improvement plans at national, hospital group and hospital levels. The implementation of these plans is coordinated by an oversight group, and a wide range of initiatives have already been introduced across Ireland's public acute hospitals. Some examples of these initiatives can be seen at <https://yourexperience.ie/inpatient/hospital-initiatives/>.

What were the main findings for Our Lady of Lourdes Hospital?

The majority of participants from Our Lady of Lourdes Hospital reported positive experiences in hospital. 82% of participants said they had 'good' or 'very good' overall experiences, compared with 84% nationally. The hospital scored above the national average for questions on the 'admissions' stage of care, and about the same as the national average for all other stages.²

Three areas of good experience were identified. These were areas where participants gave significantly above-average ratings. For example, many patients said that they were treated with respect and dignity in the emergency department and had privacy while being examined or treated. Furthermore, most patients said that staff introduced themselves.

¹ The survey was previously entitled the 'National Patient Experience Survey'. The name was updated in 2019 to more accurately reflect the target population.

² When there is no statistically significant difference between the hospital's score and the national average, it is described as 'about the same'.

There was also one area needing improvement. While the majority of patients said that they were given a choice of food, the hospital scored below the national average for this question.

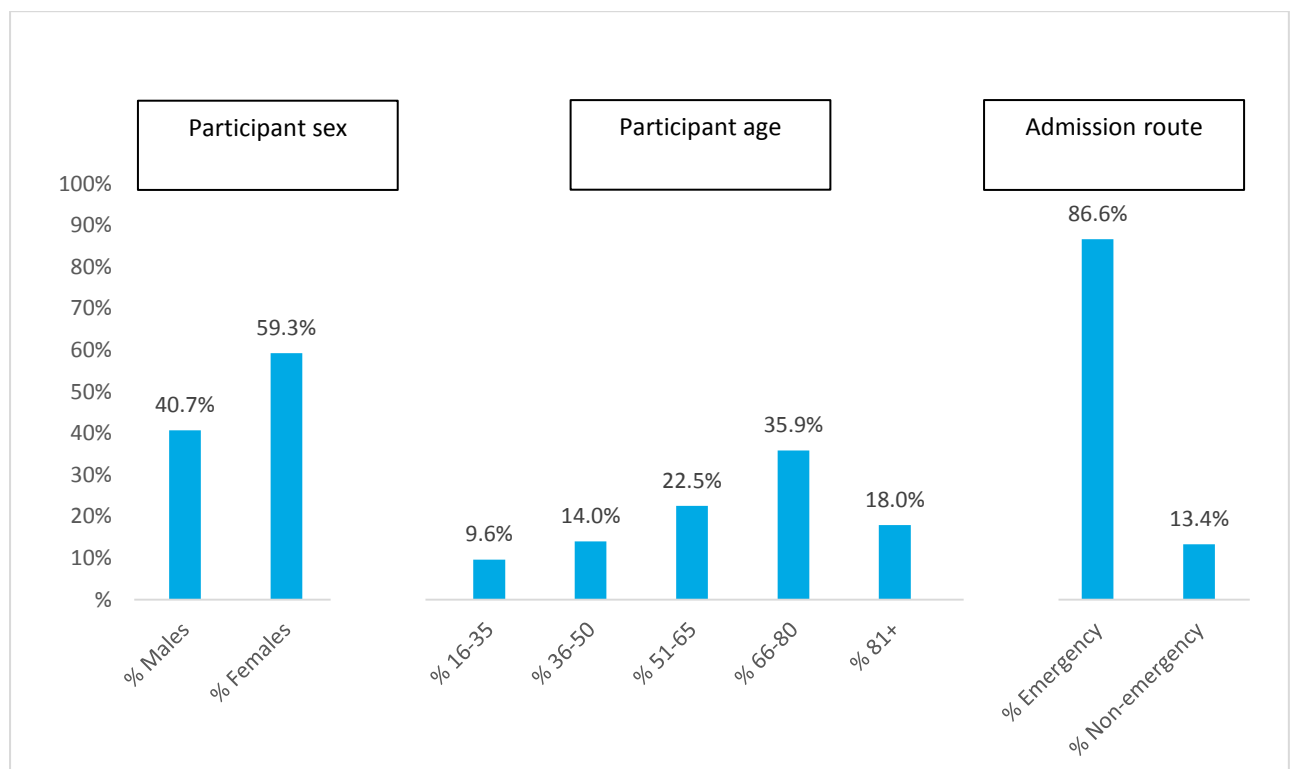

There was a significant improvement in the patient experience rating for the 'admissions' stage of care in 2019, whilst ratings for other stages of care remained largely the same as in 2018. The findings of the 2019 survey will help Our Lady of Lourdes Hospital to improve patients' experiences of care in hospital.

Hospital and participant profile

Our Lady of Lourdes Hospital is located in Drogheda, Co Louth. There were 393 inpatient beds available in the hospital during the survey period of May 2019.

1,078 people discharged from Our Lady of Lourdes Hospital during the month of May 2019 were invited to participate in the survey. 479 people completed the survey, achieving a response rate of 44%. 40.7% of participants were male and 59.3% were female. 415 respondents (86.6%) said that their stay in hospital was due to an emergency. Figure 1 below provides information on the respondents who took part in the survey from Our Lady of Lourdes Hospital.

Figure 1 Participants from Our Lady of Lourdes Hospital by sex, age group and admission route

Areas of good experience and areas needing improvement

This section lists the areas where most patients had positive experiences, and those areas where there is the most room for improvement. The list includes the relevant stage of care and question number for each area. Appendix 1 explains how these areas were identified.

The areas of good experience in Our Lady of Lourdes Hospital are:

Admissions

Privacy while being examined or treated in the emergency department | Q5

Of the 387 people who answered this question, 324 (84%) said that they were always given enough privacy while being examined or treated in the emergency department.

Admissions

Respect and dignity in the emergency department | Q6

347 (88%) of the 395 people who answered this question said that they were always treated with respect and dignity in the emergency department.

Care on the ward

Staff introductions | Q14

Of the 442 people who answered this question, 357 (81%) said that all of the staff introduced themselves.

The areas needing improvement in Our Lady of Lourdes Hospital are:

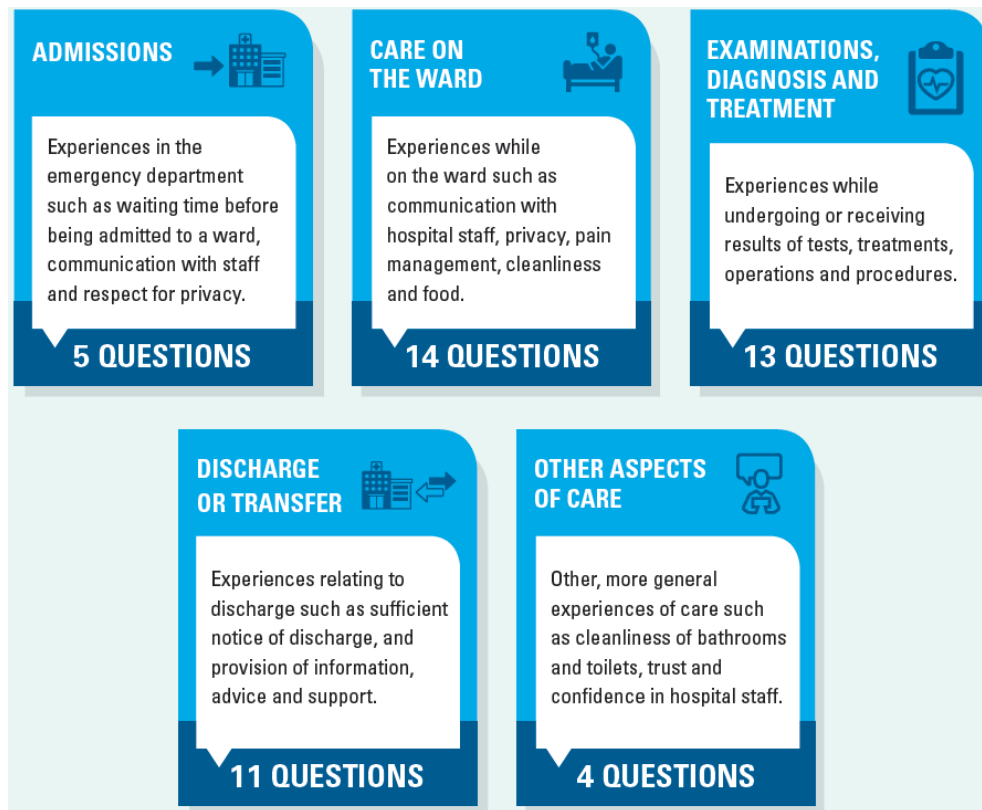

Care on the ward

Choice of food | Q16

Of the 423 people who answered this question, 288 (68%) said that they were always offered a choice of food. The hospital scored below the national average on this question.

Survey results for the stages of care along the patient journey

The National Inpatient Experience Survey 2019 follows the patient journey through hospital from admission to discharge. The 2019 questionnaire is available to download from www.yourexperience.ie. The survey questions were grouped into five stages along the patient journey:

Interpreting the results for the stages of care

Scores out of 10 are given for each question belonging to a stage of care or to a stage as a whole. A score of 0 indicates a very negative experience and a score of 10 indicates a very positive experience. Sometimes questions are described as high- or low-ranking questions. These are questions with the highest or lowest score when compared to a set of questions.

Statistical tests were carried out to examine if there were significant differences in patient experience between 2018 and 2019, as well as between a hospital and the national average. Throughout this report, when the hospital scored significantly above the national average, this is described as 'higher'. When a hospital scored significantly below the national average, it is described as 'lower'. When there is no statistically significant difference between the hospital's score and the national average, it is described as 'about the same'.

For further information on the analyses please consult Appendix 3 of the 2019 national report, available from www.yourexperience.ie.

Changes in patient experience over time

There was a statistically significant improvement in the patient experience rating for the 'admissions' stage of care in 2019, whilst ratings for other stages of care remained largely the same as in 2018. Figure 2 shows a comparison of scores for individual stages of care.

It is important that these changes are interpreted with caution as scores will naturally vary from year to year for a variety of reasons. Several rounds of survey data will be required before meaningful trends and changes in patient experience can be accurately identified.

Figure 2 Annual comparison of stage of care scores³ for Our Lady of Lourdes Hospital

³ Scores for the stages of care were constructed by calculating the average scores for all the questions belonging to that stage.

Admissions

Figure 3 compares the hospital's overall score for 'admissions' with the national average. Figure 4 shows the hospital's scores for questions on this stage of care.

Figure 3 Comparison of Our Lady of Lourdes Hospital with the national average score for 'admissions' (out of a maximum of 10).

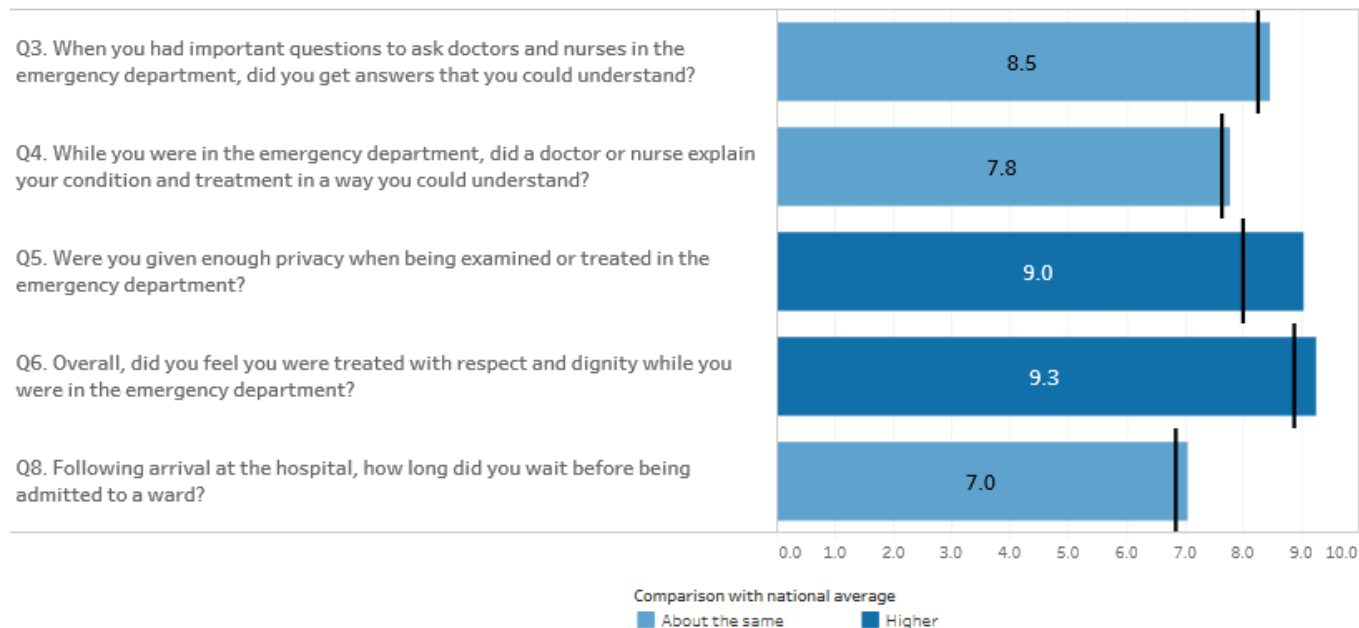

Figure 4 Our Lady of Lourdes Hospital scores for questions on 'admissions'*

*The black line represents the national average

Emergency department waiting times⁴

The HSE sets targets for the performance of acute hospitals, including targets on waiting times in emergency departments, such as:

- 75% of people attending the emergency department are discharged or admitted to a ward within six hours of registration and none should wait for longer than nine hours.
- 95% of people attending the emergency department aged 75 years or older are discharged or admitted to a ward within six hours of registration and none should wait for longer than nine hours.

In Our Lady of Lourdes Hospital, 109 respondents (31%) said they were admitted to a ward within six hours of arriving at the emergency department, while 208 respondents (59%) reported waiting between six and 24 hours. 37 respondents (10%) said that they waited 24 hours or more before being admitted to a ward in Our Lady of Lourdes Hospital, with 11 of these saying they waited more than 48 hours. As outlined in Appendix 1, the relationship between waiting times and overall experience was relatively weak. This means that patients who had long waiting times did not always say they had a negative overall experience. Figure 5 outlines the emergency department waiting times, as reported by patients in Our Lady of Lourdes Hospital, compared with the national average.

Figure 5 Emergency department waiting times, as reported by patients for Our Lady of Lourdes Hospital and nationally

Admissions: what do these results mean?

Patient ratings of admission to Our Lady of Lourdes Hospital were higher than both the national average and the hospital's 2018 score. Most patients said they were treated with respect and dignity in the emergency department. The lowest scoring question related to waiting times before admission to a ward.

⁴ The HSE measures emergency department waiting times differently to the survey, namely from the time a patient registers at the emergency department until they leave it. It is likely that there are some differences between survey findings and the official HSE figures. The HSE 2019 targets can be viewed at: <https://www.hse.ie/eng/services/publications/kpis/acute-hospitals-metadata-2019.pdf>

Care on the ward

Figure 6 compares the hospital's overall score for 'care on the ward' with the national average. Figure 7 shows the hospital's scores for questions on this stage of care.

Figure 6 Comparison of Our Lady of Lourdes Hospital with the national average score for 'care on the ward' (out of a maximum of 10).

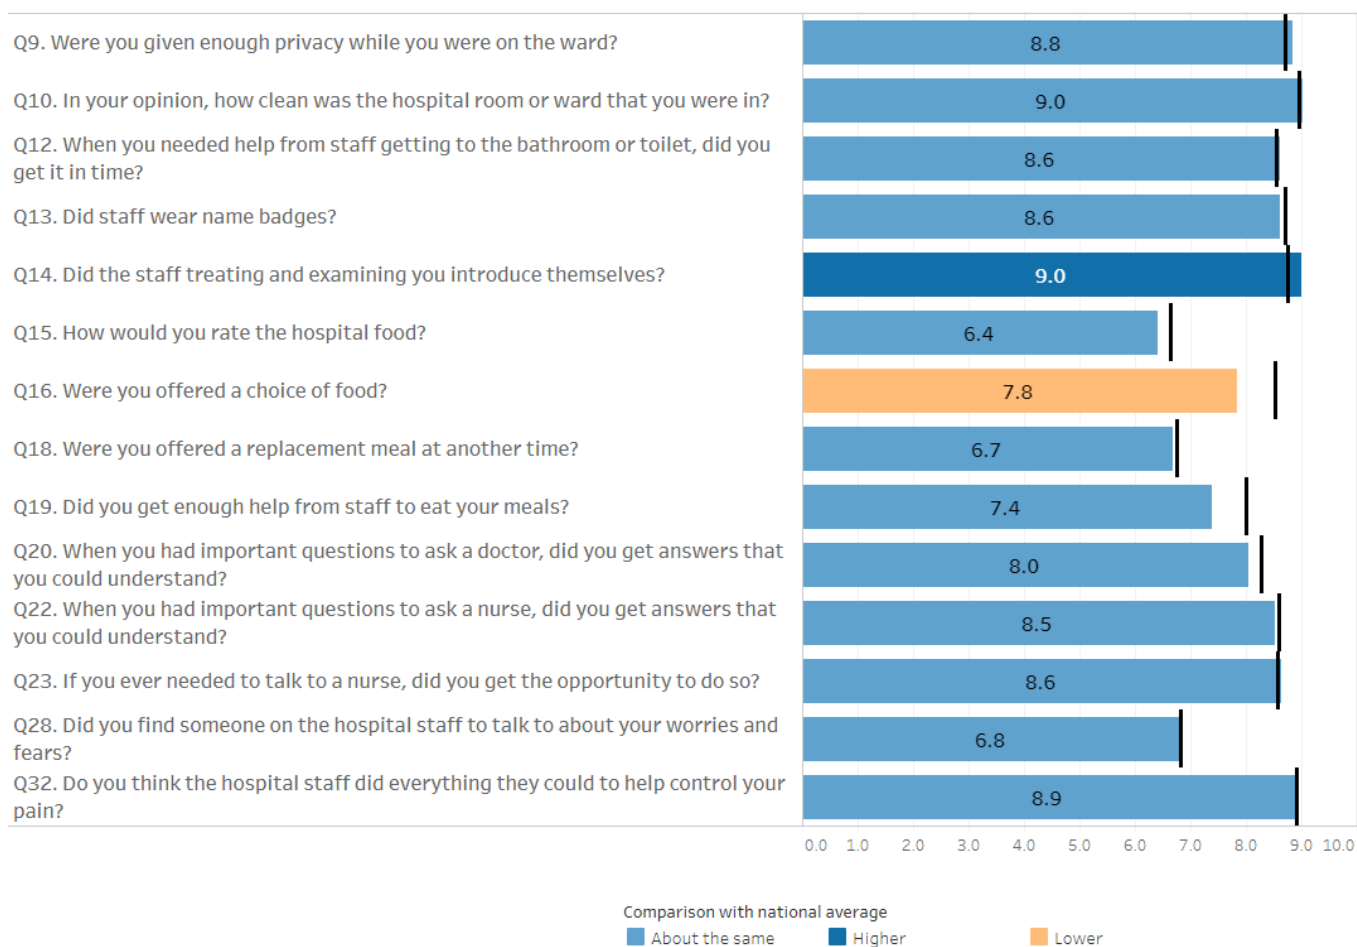

Figure 7 Our Lady of Lourdes Hospital scores for questions on 'care on the ward'*

*The black line represents the national average

Care on the ward: what do these results mean?

Patient ratings of 'care on the ward' in Our Lady of Lourdes Hospital were similar to the national average and to last year's survey. Most patients gave a positive rating of the cleanliness of rooms and wards, and said that staff introduced themselves. The lowest scoring question for this stage related to patient ratings of the food.

Examinations, diagnosis and treatment

Figure 8 compares the hospital's overall score for 'examinations, diagnosis and treatment' with the national average. Figure 9 shows the hospital's scores for questions on this stage of care.

Figure 8 Comparison of Our Lady of Lourdes Hospital with the national average score for 'examinations, diagnosis and treatment' (out of a maximum of 10).

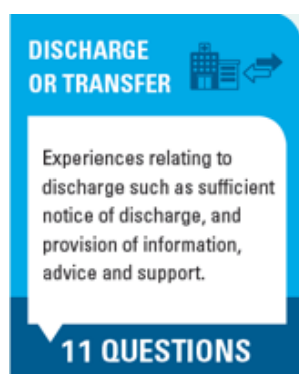

Figure 9 Our Lady of Lourdes Hospital scores for questions on 'examinations, diagnosis and treatment'*

*The black line represents the national average

Examinations, diagnosis and treatment: what do these results mean?

Ratings of 'examination, diagnosis and treatment' were similar to the national average and to last year's survey. Most patients said that they were given enough privacy while being examined or treated. The lowest scoring question for this stage related to patients' involvement in decisions about their care and treatment.

Discharge or transfer

Figure 10 compares the hospital's overall score for 'discharge or transfer' with the national average. Figure 11 shows the hospital's scores for questions on this stage of care.

Figure 10 Comparison of Our Lady of Lourdes Hospital with the national average score for 'discharge or transfer' (out of a maximum of 10).

Figure 11 Our Lady of Lourdes Hospital scores for questions on 'discharge or transfer'*

*The black line represents the national average

Discharge or transfer: what do these results mean?

Participant ratings for this stage of care were similar to the national average and to last year's survey. Most patients said that they, or someone close to them, were given sufficient notice about their discharge from hospital. The lowest scoring question for this stage related to whether the side effects of medications were explained to patients in a way they could understand.

**OTHER ASPECTS
OF CARE**

Other, more general experiences of care such as cleanliness of bathrooms and toilets, trust and confidence in hospital staff.

4 QUESTIONS

Other aspects of care

Figure 12 shows the hospital's scores for questions on this stage of care.

Figure 12 Our Lady of Lourdes Hospital scores for 'other aspects of care'*

*The black line represents the national average

Other aspects of care: what do these results mean?

Most participants said they were always treated with respect and dignity while in hospital, and had confidence and trust in hospital staff. On the other hand, a number of patients said that there were insufficient opportunities for their families to talk to a doctor.

Overall experience

Respondents were asked to rate their overall hospital experience on a scale from 0 to 10, with 10 being the most positive experience, and 0 the most negative experience. 52% of participants from Our Lady of Lourdes Hospital rated their care as very good, slightly below the national figure of 56%.

Figure 13 compares the average overall rating of hospital experience for Our Lady of Lourdes Hospital with the national average.

Figure 13 Overall rating of hospital experience for Our Lady of Lourdes Hospital and nationally

In their own words: analysis of patients' comments

The last three questions (questions 59-61) of the survey asked patients to provide additional information, in their own words, on their experiences in hospital. These free-text questions allowed people to give a more in-depth description of specific aspects of their care. It also allowed them to talk about various things (good or bad) that could not be captured by the structured questions. In total, 657 comments were received from patients of Our Lady of Lourdes Hospital in response to the free-text questions in the 2019 survey.

Figure 14 shows the breakdown of comments by theme for each of the three open-ended questions. Q59 asked participants what was particularly good about their hospital care, Q60 asked participants what could be improved, and Q61 asked participants for any other comments or suggestions.

When asked what was good about their care, most patient comments related to the 'hospital staff', 'general and other comments' and 'physical environment' themes. Most of the comments suggesting improvements related to the 'physical environment'; 'hospital staff', and 'general and other comments' themes. Responses to Q61 covered various themes. A selection of relevant comments from these themes is provided in Figure 15.

Figure 14 Participant comments by theme

Figure 15 Example comments

Positive comments

"The staff nurses and doctors could not have been any nicer. The care I got was absolutely brilliant. The nurses were run off their feet and they still gave me top class care. Cannot thank them enough."	"I was very pleased with my first experience of treatment in the Lourdes Hospital, Drogheda! (Consultants, doctors, nurses and ancillary staff were excellent!)"
"From admission to discharge I was treated with dignity and respect. I was a very anxious patient and all staff had lots of patience and empathy. They answered all questions and calmed me down."	"The nurses were caring and considerate. Also, I found the doctors helpful and informative. I hope not to be in hospital again, but if so I would choose Lourdes!"
"Everything was good, from consultants to cleaners and kitchen staff, nursing and clerical; the care I was given was top class. I really appreciate the help I was given. Please pass on my thanks. 5 star treatment."	"I was really well taken care of — doctors nurses and staff in general were extremely caring and I appreciate being looked after in such a caring way."

Suggestions for improvement

"I found the food very poor, I feel it was not nutritious and I relied on family members to bring in sandwiches or soup to me. When I ordered food for the next day, I did not always get what I ordered. And then I'd be told that I did order it. I felt this confused me a lot during my stay."
"The ward where I was staying was very noisy at night. I understand that some level of noise is unavoidable but staff conversations could be quite loud at times. Other than that staff were wonderful!"
"Information given about post-procedure care. I do not feel I was given much information or advice, e.g. I was not told anything about my stitches. If they were dissolvable, or if I should have follow up with my GP."

Conclusion

What were patients' experiences of hospital care in Our Lady of Lourdes Hospital in May 2019?

The majority of patients said that they had positive overall experiences in Our Lady of Lourdes Hospital. 82% of patients said they had a 'good' or 'very good' experience, compared with 84% nationally.

Our Lady of Lourdes Hospital received above-average ratings for the 'admissions' stage of care and ratings that were about the same as the national average for the other stages. Participant ratings of care were generally similar to those received in 2018, with the exception of 'admissions' which improved significantly.

Three areas of good experience were identified. These were areas where participants gave significantly above-average ratings. For example, many patients said that they were treated with respect and dignity in the emergency department and had privacy while being examined or treated. Furthermore, most patients said that staff introduced themselves.

There was also one area needing improvement. While the majority of patients said that they were given a choice of food, the hospital scored below the national average for this question.

The findings of the 2019 survey will be used to help Our Lady of Lourdes Hospital improve the experiences of patients in hospital.

Appendix 1: Areas of good experience and areas needing improvement

Improvement map

It is important for hospitals to know if they scored above or below the national average for each question, and this is shown in the improvement map in Figure 16. The improvement map also shows which questions are related to patients' overall experience in hospital. Some questions had a stronger relationship with overall experience than others.

For example, Question 51 which asked patients if they were treated with respect and dignity had a strong relationship with overall experience. This means that patients who said they were treated with respect and dignity were very likely to give a positive rating of their overall experience. Patients who felt they were not treated with respect and dignity tended to give more negative ratings of their overall experience.

Other questions had a weaker relationship with overall experience – this means that patients' experiences in these areas had little bearing on how they rated their overall experience. An example is Question 13 which asked patients if hospital staff wore name badges. The relationship between staff wearing name badges and patients' ratings of their overall experience was weak. This means that even if all staff wore name badges, patients may have given negative ratings of their overall experience, or if no staff wore name badges, patients may still have given positive ratings of their overall experience.

It is useful for hospitals to know which questions strongly relate to their patients' overall experience as these are the areas on which they should focus their improvement efforts.

In Figure 16, each dot shows a specific survey question for Our Lady of Lourdes Hospital. Questions at the top of the graph are strongly related to overall experience, while those at the bottom have a weaker relationship. Questions to the right of the graph scored below the national average, while those on the left scored above it.

Questions that scored significantly above average and had a stronger relationship with overall experience are areas of good experience. Questions that scored significantly below average and had a stronger relationship with overall experience are areas needing improvement.

The improvement map for each hospital is unique and gives specific information on where a hospital is doing well, and areas where improvements are needed. More information on the science behind the improvement map is available below. An interactive version of the improvement map is also available at <http://www.yourexperience.ie/> along with instructions on how to interpret it.

Figure 16 Improvement Map for Our Lady of Lourdes Hospital

How the improvement map is constructed

The improvement map is constructed by charting the normalised correlation between each question and overall experience on the vertical axis, against the difference between the hospital average and national average for each question on the horizontal axis.

What is correlation?

Correlation is a measure of the relationship between two variables. For example, in general there is a strong correlation between patients saying they were treated with respect and dignity, and patients giving a positive rating of their overall experience in hospital. It can thus be said that there is a strong correlation between respect and dignity, and overall experience. A 'correlation coefficient' is a number between 0 and 1 that represents the strength of a relationship, with 1 being the strongest possible relationship and 0 indicating that there is no relationship. Correlation does not tell us if a change in one variable is caused by a change in the other.

How do we calculate the correlation coefficient?

The first step in calculating the correlation coefficient between two variables is to calculate their 'covariance'. Covariance is a simple measure of the relationship between two variables and is calculated using the formula below:

$$\text{COV}_{xy} = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{n - 1}$$

While covariance does measure the relationship between variables, it does so in an unstandardised way, depending on the scale of measurement used. This makes comparing covariances measured on different scales problematic. In order to get around this issue, 'standardisation' must be carried out. In order to do this, the covariance for both variables must be divided by the product of the standard deviations for each variable. The formula below shows how standardisation is carried out, resulting in r , known as the 'Pearson correlation coefficient'.

$$r = \frac{\text{COV}_{xy}}{s_x s_y} = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{(N - 1) s_x s_y}$$

The final step in the analysis is to normalise the correlation coefficients between 0 and 1 using the below formula:

$$r = \frac{r - r_{\min}}{r_{\max} - r_{\min}}$$

In Figure 16, we plot the correlation coefficients between each question and overall experience on the vertical axis. Each question's difference from the national average is plotted on the horizontal axis.

How do we calculate difference from the national average?

Statistical tests were carried out to examine if there were significant differences between a hospital's score for each question and the national average for that question. A z-test was used to compare question scores at the 99% confidence level. A z-test is a statistical test used to examine whether two population mean scores are different. A statistically significant difference means it is very unlikely that results were obtained by chance alone if there was no real difference. Therefore, when a score is significantly 'higher than' or 'lower than' the national average, this is highly unlikely to have occurred by chance.
